Durham University

Introduction to Music Computing

Symbolic representations of music data

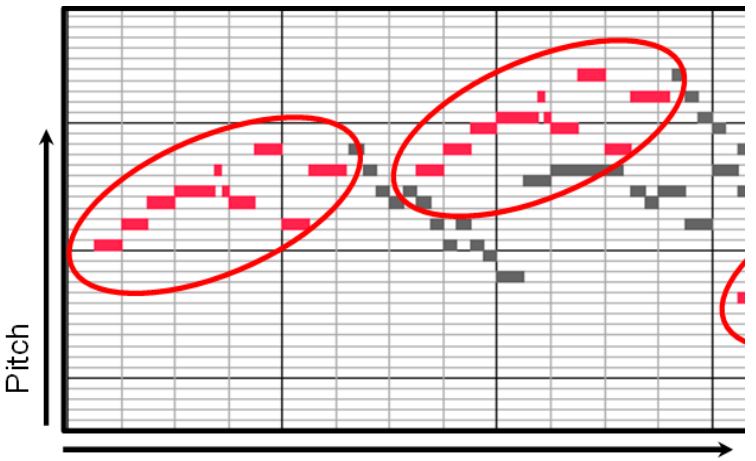
Dr Eamonn Bell
eamonn.bell@durham.ac.uk

Piano roll representation

An **piano-roll representation** of a musical work shows us

- the pitches that we can hear
- the start time of each pitch
- the end time of each pitch

It is a **symbolic** representation, because it is based on a finite alphabet of letters or symbols



[FMP21] Fig 1.12

Piano roll

The origin of “piano roll” notation is in the design and construction of **player pianos** (dating from the 19th century)

An alternative form of music distribution

Punched holes control actuators that strike and release piano keys in sequence

Many formats, some allowing for “expression” such as relative loudness, use of pedal...

[FMP21] Fig 1.11

Automatic music transcription

We can estimate the piano-roll representation from an audio file, usually with the help of a **spectrogram** representation (why?)

This is part of the complex task of **automatic music transcription**, and effectively converts from audio representations to symbolic representations

What is not captured in piano-roll representations?

MIDI

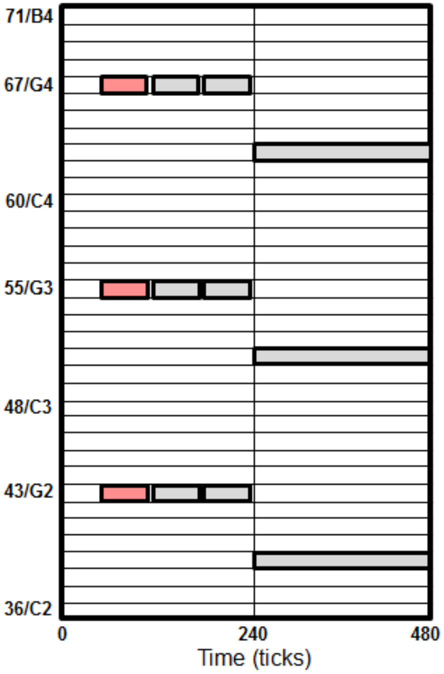
MIDI files are a standard means of representing music (and other time-based media) data

Origins as an interchange format

Event-based, with a tick length

Format 0, 1, 2 (different track/channel relation)

Also track-level metadata, pitch bend...



Time (Ticks)	Message	Channel	Note Number	Velocity
60	NOTE ON	1	67	100
0	NOTE ON	1	55	100
0	NOTE ON	2	43	100
55	NOTE OFF	1	67	0
0	NOTE OFF	1	55	0
0	NOTE OFF	2	43	0
5	NOTE ON	1	67	100
0	NOTE ON	1	55	100
0	NOTE ON	2	43	100
55	NOTE OFF	1	67	0
0	NOTE OFF	1	55	0
0	NOTE OFF	2	43	0
5	NOTE ON	1	67	100
0	NOTE ON	1	55	100

Intervals measure distance in pitch height

An **interval** is the pitch difference between two sounds with determinate pitches

We can describe intervals simply by counting the number of semitones between the two pitches

Clearly, this is linked to the notion of twelve-tone equal temperament

Common names for intervals

There is another naming system, which is more closely linked to music notation. For example:

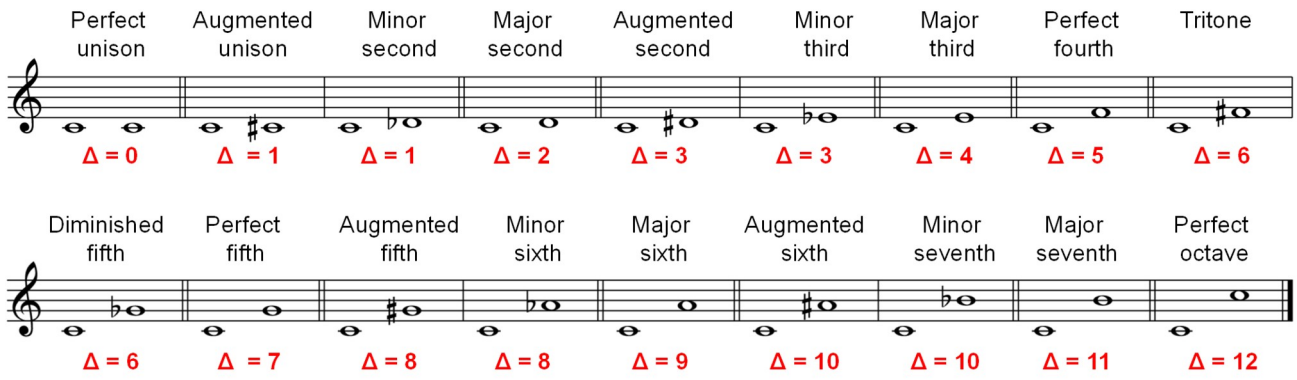
- minor second (= 1 semitones)
- minor third (= 3 semitones)
- perfect fourth (= 5 semitones)
- diminished fifth (= 6 semitones)
- (perfect) octave (= ? semitones)

In this naming system, an interval has a

- **quality** (e.g. minor, major, perfect etc.)
- **size** (e.g. second, third, seventh, eleventh etc.)

Intervals - Reference

Δ	Interval name	Interval	JI ratio
0	(Perfect) unison	C4 – C4	1:1
1	Minor second	C4 – D♭4	15:16
2	Major second	C4 – D4	8:9
3	Minor third	C4 – E♭4	5:6
4	Major third	C4 – E4	4:5
5	(Perfect) fourth	C4 – F4	3:4
6	Tritone	C4 – F♯4	32:45
7	(Perfect) fifth	C4 – G4	2:3
8	Minor sixth	C4 – A♭4	5:8
9	Major sixth	C4 – A4	3:5
10	Minor seventh	C4 – B♭4	5:9
11	Major seventh	C4 – B4	8:15
12	(Perfect) octave	C4 – C5	1:2



[FMP21] Figs 5.2, 5.3 (adapted)

Durham University

Application: Query by melody

- We can represent each tune as a sequence of melodic intervals from some starting point
- Insert tunes into database index
  - Convert each tune into a sequence of melodic intervals d_i (e.g. {-2, +3, +2, -7, ...})
- Query by melody
  - Convert a given query to sequence of melodic intervals q
- For each song in database, compute the similarity D(q, d_i), rank, and return
- **Improvements**: melody/query representation, indexing of fragments, domain-specific similarity measures

Chords

A chord can be thought of as a set of pitches.

A chord consisting of three pitches is a **triad**. Certain triads are fundamental to tonal music.

Examples of these triads are:

- **C** = {C, E, G}
- **G** = {G, B, D}
- **Am** = {A, C, E}
- **E♭** = {E♭, G, B♭}
- **F♯m** = {F♯, A, C♯}

In these definitions/examples, we do not make a note of the octave (cf. SPN). Why not?

Chord types

For this part, we restrict our attention to a subset of all possible chords, **triads**, and within that we focus for now on two types:

- **major triads** (e.g. **C**, **G**)
- **minor triads** (e.g. **F♯m**, **Am**)

major triads := two notes separated by a perfect fifth, and a third note which is a major third above the lower of the two notes

minor triads := two notes separated by a perfect fifth, and a third note which is a major third above the lower of the two notes

[FMP21] Fig 1.18

Key – We're not there just yet

"key" (or a comparable concept) is an important aspect of most tonal music

You may have heard people talk about music in a **major** key vs. music in a **minor** key

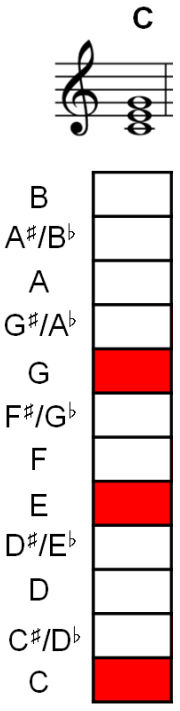
Key is related to the number and frequency the chords used in a piece, the contexts in which they are used, and other considerations.

When it comes to triads (and intervals), major and minor just refer to qualities ("species") of collections of notes, nothing more

Simple representation for chords

Represent each chord as a multi-hot 12-place vector, where the entry is 1 if the chord contains the chroma at that place

The vector for **C** = {C, E, G} is shown on the right



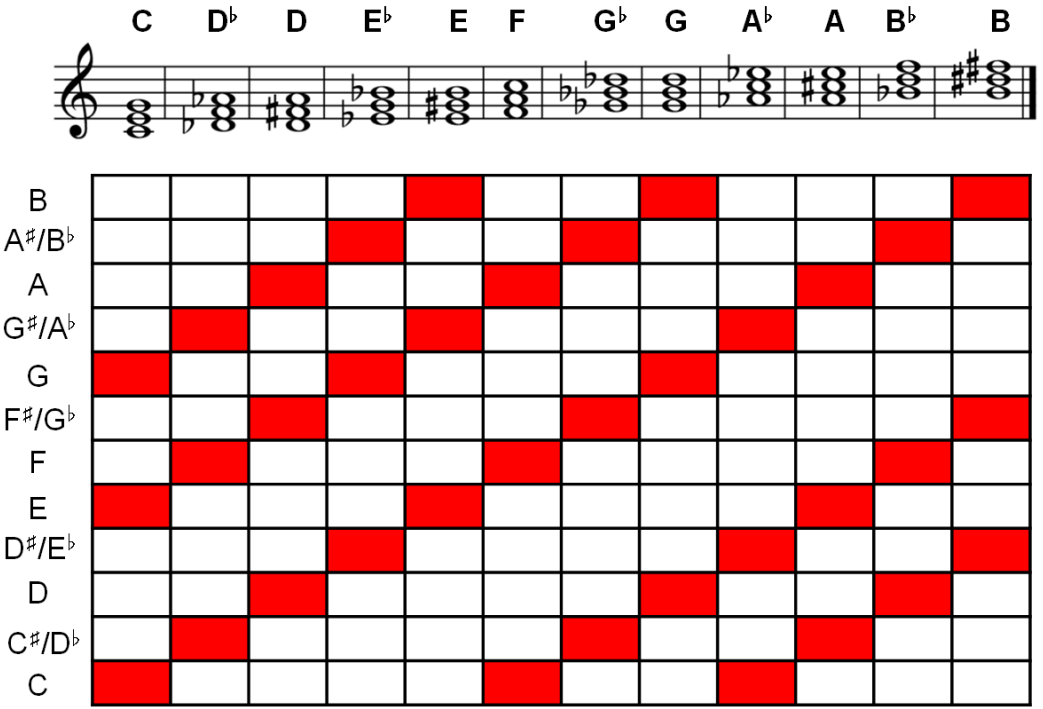
[FMP21] Fig 5.6 (adapted)

Simple representation for chords

Represent each chord as a multi-hot 12-place vector, where the entry is 1 if the chord contains the chroma at that place

Shown on the left are the major triads

Using indicator vectors is a classical way to represent subsets



[FMP21] Fig 5.6

Simple representation for chords

Represent each chord as a multi-hot 12-place vector, where the entry is 1 if the chord contains the chroma at that place

Can you complete the same grid for minor triads?

[FMP21] Fig 5.6 (adapted)

Another view on chords

- We have seen how we can “generate” the set of major (and minor) chords by performing a cyclic shift of the multi-hot vector
- Another common approach to modeling chords is to do as follows:
  - Assign each chroma (pitch class) to an integer mod 12
  - Conventionally: C = 0, C# = 1, etc.
  - Consider chords as collections of integers mod 12, called **pitch-class sets**: **Cm** becomes {0, 4, 7}
- Define some operations on these collections
  - e.g. $T_n(\{0, 3, 4\})$ → $\{(0 + n) \bmod 12, (3 + n) \bmod 12, (4 + n) \bmod 12\}$
- Study the equivalence classes of pitch-class sets these operations: “**set classes**”

Consonance and dissonance

An interval may be **consonant** or **dissonant.** The following intervals are considered consonant:

- unison, octave, perfect fifth, perfect fourth, major third, minor third
- major sixth, minor sixth

The following intervals are considered dissonant:

- others

By extension, we can also speak of the consonance and dissonance of particular **chords**, **scales**, pieces etc.

Δ	Interval name	Interval	JI ratio
0	(Perfect) unison	C4 – C4	1:1
1	Minor second	C4 – D♭4	15:16
2	Major second	C4 – D4	8:9
3	Minor third	C4 – E♭4	5:6
4	Major third	C4 – E4	4:5
5	(Perfect) fourth	C4 – F4	3:4
6	Tritone	C4 – F♯4	32:45
7	(Perfect) fifth	C4 – G4	2:3
8	Minor sixth	C4 – A♭4	5:8
9	Major sixth	C4 – A4	3:5
10	Minor seventh	C4 – B♭4	5:9
11	Major seventh	C4 – B4	8:15
12	(Perfect) octave	C4 – C5	1:2

[FMP21] Fig 5.3

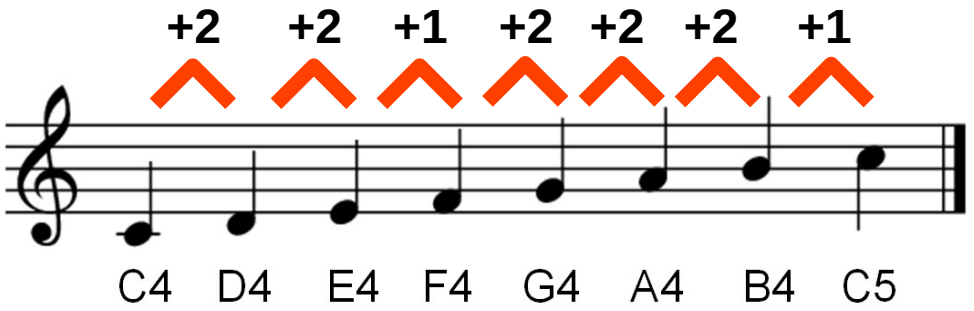
Scales

A **scale** is an ordered set of notes, conventionally ordered by ascending pitch. Here are two scales:

[FMP21] Fig 1.5

Scales

A **scale** is an ordered set of notes, conventionally ordered by ascending pitch. The following is an example of a **major scale**:



[FMP21] Fig 1.5

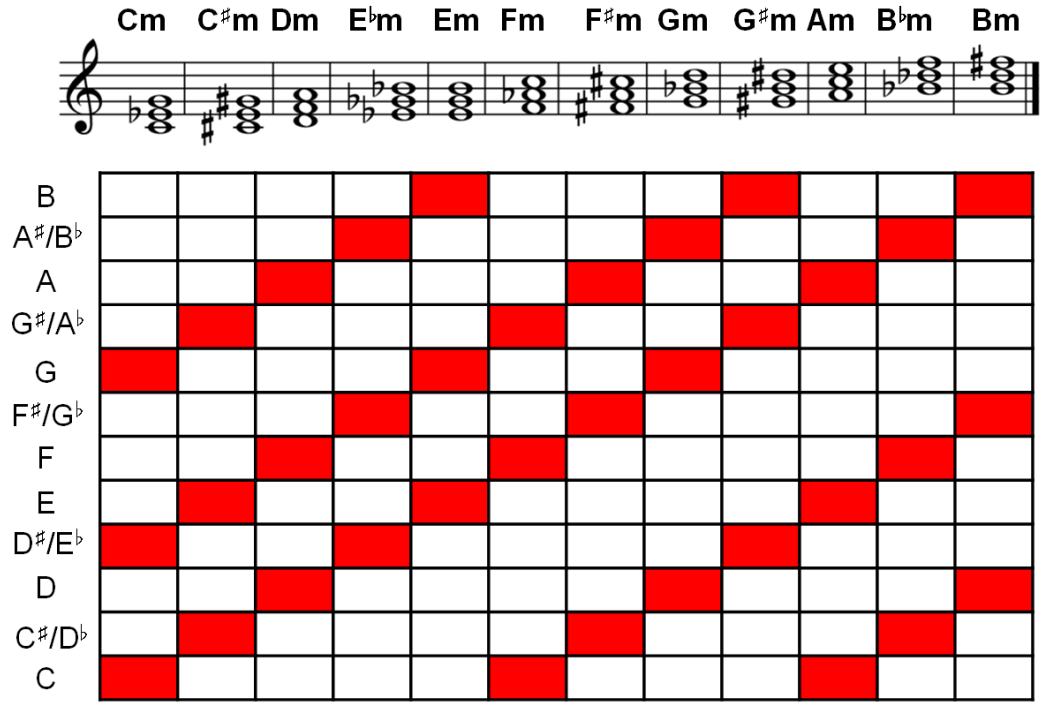
The scale can be defined by the pattern of intervals, here measured in semitones (cf. MIDI note numbers) starting from a given pitch.

The letter name of the starting pitch (the **key note**) gives the scale its identity (hence, **C major scale**)

Simple representation for chords

Represent each chord as a multi-hot 12-place vector, where the entry is 1 if the chord contains the chroma at that place

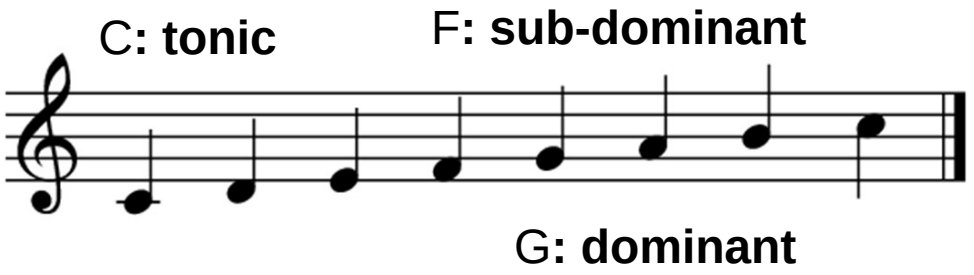
Can you complete the same grid for minor triads?



[FMP21] Fig 5.6 (adapted)

Scales

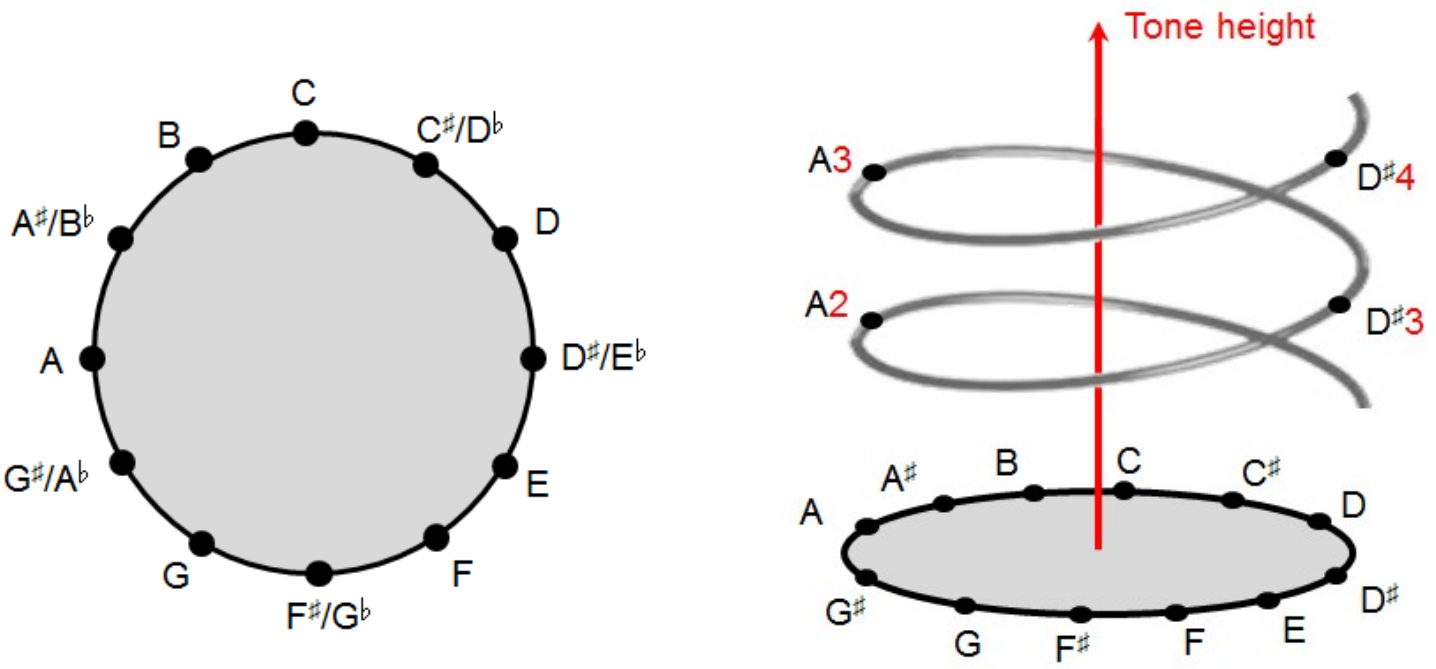
In the case of some scales, there are special names for the notes in the scale, relative to the key note:



[FMP21] Fig 1.5 (adapted)

In the case of a D major scale, what is the note name for the **tonic**? The **dominant**?

Perception of pitch height vs. pitch “class”



[FMP21] Fig 1.3

Scales

Some other scales, viewed as patterns of intervals measured in semitones:

- **natural minor:**
  - +2, +1, +2, +2, +1, +2, +2
- **Dorian:**
  - +2, +1, +2, +2, +2, +1, +2
- **whole tone:**
  - +2, +2, +2, +2, +2, +2
- **pentatonic:**
  - +2, +2, +3, +2, +3

Succession and simultaneity – intervals

Music is more than intervals, chords, and scales.

They are useful abstractions that have **realisations** in actual music in a variety of ways.

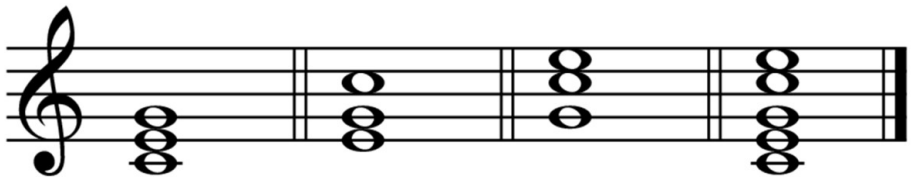
e.g. minor sixth: successively (as a **melodic** interval)

or simultaneously (as a **harmonic** interval)

Succession and simultaneity – chords

Similarly, chords can be realised at the surface level of a musical work in different but related ways as follows:

All count as expressions of a C major triad



[FMP21] Fig 5.7 (adapted)

Rhythm

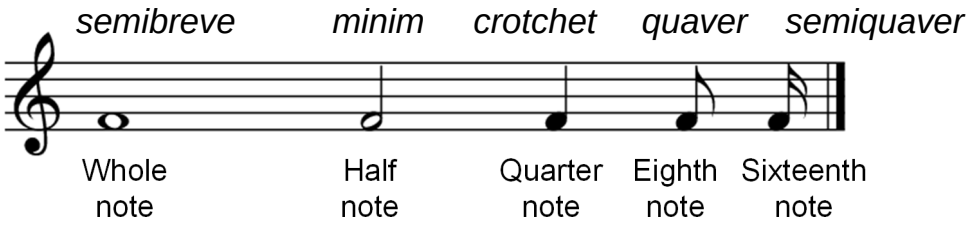
Musical events happen in time, so they have a start time and a duration. The goal of staff notation is to show this information at the same time as the pitch(es) played.

Some events are relatively short:

Some events are relatively long. Here, everything takes twice as long as above:

Rhythm

Here is a restricted “vocabulary” of possible rhythmic symbols



There is a small set of combining and grouping rules that quickly increase the density of ink on the page

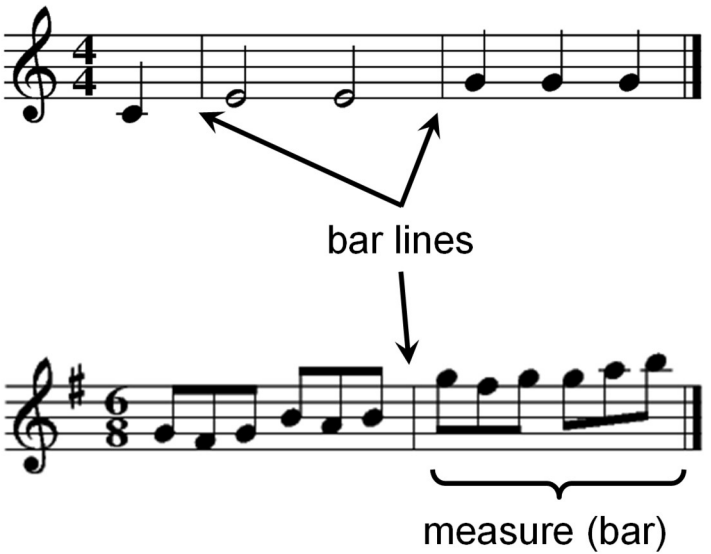
[FMP21] Fig 1.7

Rhythm

As in speech and poetry, there are common rhythmic patterns that occur frequently, including alternating patterns of stress and emphasis

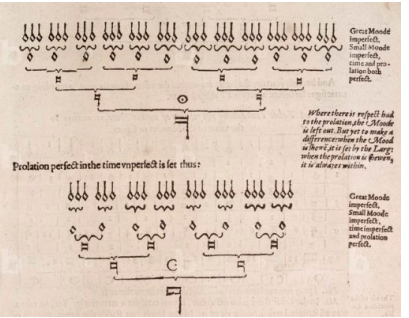
The **time signature** communicates some information (in advance) the patterns that make up the piece and are associated with conventional combining and grouping patterns



[FMP21] Fig 1.6

Plaine & Easie Code

- Legacy plaintext encoding of music dating from the 1960s [Brook et al. 1964]
  - (Spec under development: https://github.com/rism-digital/pae-code-spec)
- Designed for librarians cataloguing **incipits** (the first part of a musical document)
- Over 1.4M incipits encoded and indexed in RISM
- Example:
  - `{''6E'B8G}{GA}-''C{'3B8..G}`
- Supported by many libraries and tools but not practical for anything more than very brief examples
- Editor: https://www.verovio.org/pae-editor.html



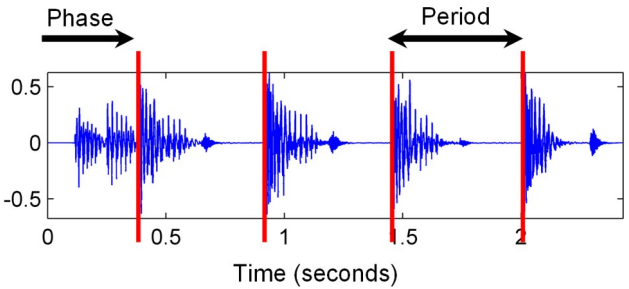
[Morley 1597]

Beat (or *tactus*)

What *motivates* music? We move to music; we move to make music.

The **beat** or ***tactus*** is the time pattern that we most naturally tap/clap along to when we hear a piece of music with a salient rhythm

It is generally **isochronous**: i.e. equally spaced out in time

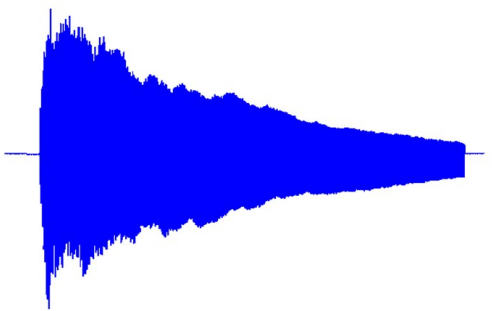


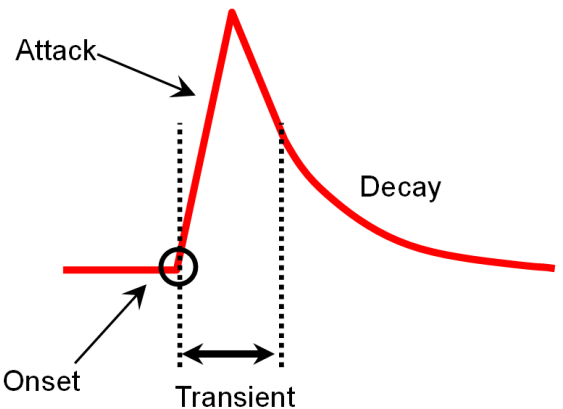
[FMP21 Fig. 6.1a]

Envelope

Recall that **dynamics** refers to the evolution of the amplitude value over time

A sound's amplitude **envelope** is the contour or shape of the extreme values of a sound, evolving in time





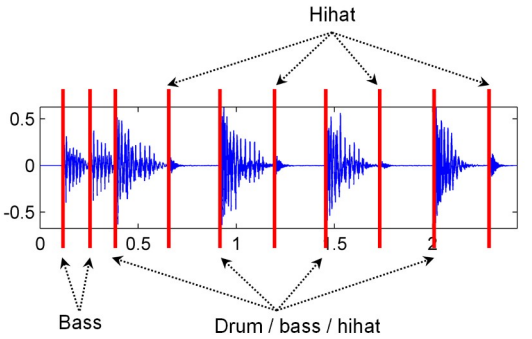
[FMP21 Fig. 6.2]

Many musical sounds have envelopes that can be idealised as shown on the right

Onsets

Onsets are the starting times of notes or other musical events as they occur in a music recording

The **onset** is the beginning of the envelope's transient (or the moment the transient can be detected/heard)



[FMP21 Fig. 6.1b]

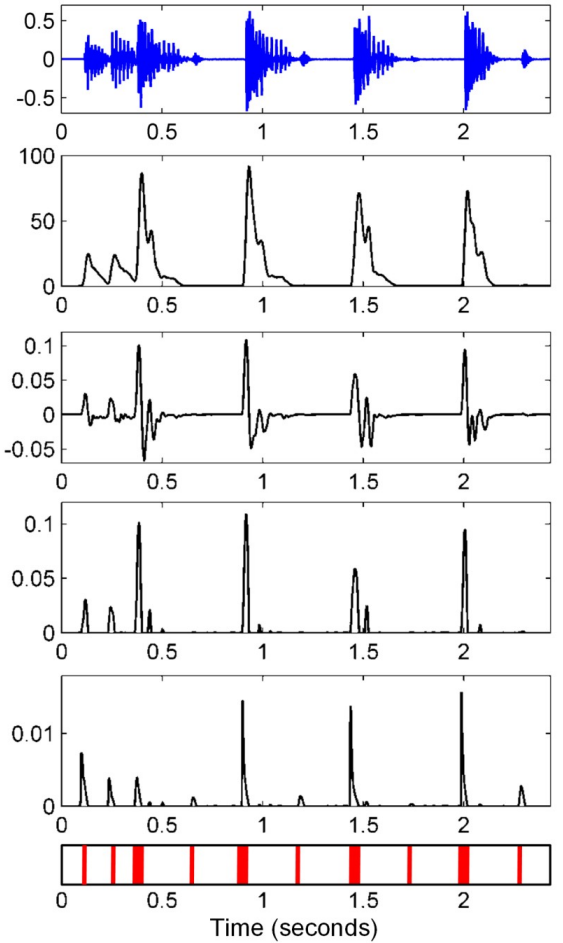
Onsets

Onsets are the starting times of notes or other musical events as they occur in a music recording

The **onset** is the beginning of the envelope's transient (or the moment the transient can be detected/heard)

Energy-based novelty approaches are easy to implement in the audio domain when the signal is well-structured

Beats, being musical events, are a special class of onsets (the **thicker** red lines). Well, almost always – why?



[FMP21 Fig. 6.3]

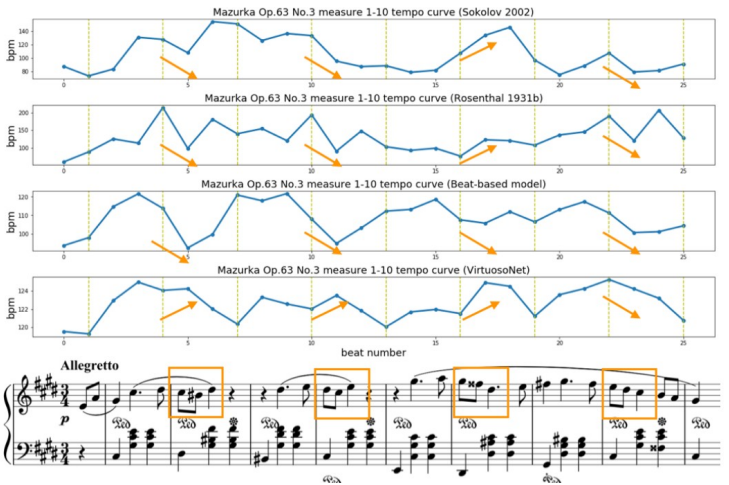
Tempo

Tempo is conventionally measured in **beats per minute** (bpm)

Different genres of music are associated with different tempos

In Western classical music, there are a set of terms used to loosely specify tempos

Varying tempo is a crucial dimension to expressive performance



[Shi 2023]

Durham University

Meter

In prosody, meter refers to the alternating patterns of stressed and unstressed syllables:

- re-TURN (return)
- TA-ble (table)

In music, there is a comparable phenomenon. Consider the difference when an instructor “counts off” a march and a waltz.

- march: “1 2 | 1 2 | 1 2 | …”
- waltz: “1 2 3 | 1 2 3 | 1 2 3 | …”

Metrical hierarchy

One of the (many) distinctive features of musical meter is that metrical stress has more than two “levels”: not just strong vs. weak.

Though there are gradations, we generally hear these levels as discrete.

In staff notation, the time signature can be thought of as a short-hand for a conventional meter and its associated hierarchy

When a particular time signature (hence, meter) is in operation, this has effects on how rhythms are notated.

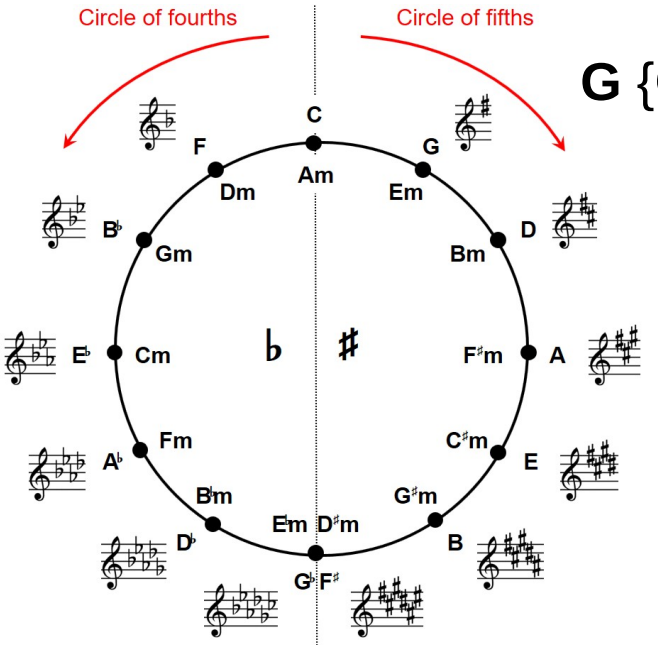
Key and scale

C {C, D, E, F, G, A, B}



G {G, A, B, C, D, E, F#}

[FMP21] Fig 5.10

Modulation

Modulation is another term for a change of key

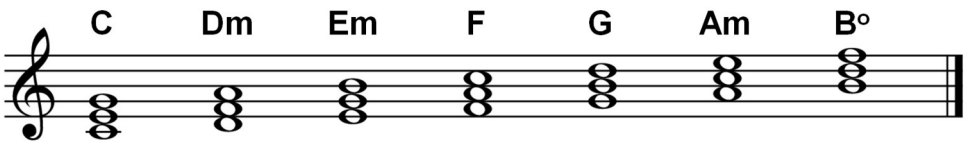
Several things contribute to our sense of what key we are in:

- scale: what collection best explains (covers) the notes we hear
- harmonic context: what chords precede and succeed
- harmonic content: what is the structure of the chord we are at
- **melodic context**: what notes precede and follow
- **melodic content**: what notes are prominent
- key context: what key (or mixture of keys) are we already in
- form: where are we in the overall journey of the piece of music

voice-leading

Building triads using scale members

Consider the set of triads that can be build using only the members of the C major scale

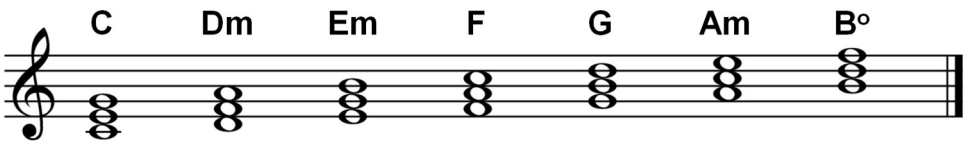


[FMP21] Fig 5.11

All are major or minor, apart from the chord built on B (a **diminished triad**)

Building triads using scale members

Consider the set of triads that can be build using only the members of the C major scale

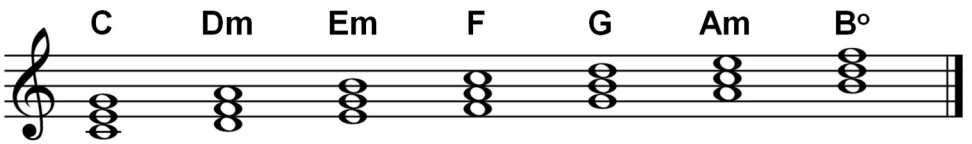


[FMP21] Fig 5.11

All are major or minor, apart from the chord built on B (a **diminished triad**)

Building triads using scale members

Consider the set of triads that can be build using only the members of the C major scale



[FMP21] Fig 5.11

All are major or minor, apart from the chord built on B (a **diminished triad**)

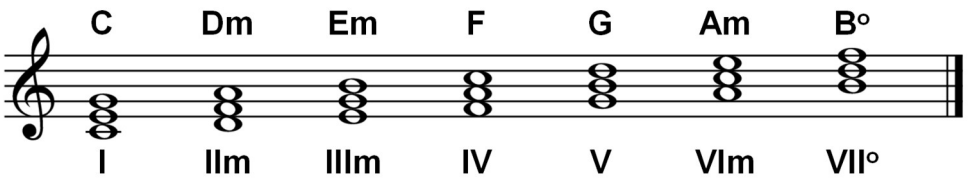
Roman numeral notation

Roman numerals can be used to identify triads (and other chords) with reference to a given scale

We use the Roman numeral equivalent of the scale degree (i.e. index) of the note on which the triad is built

We also can read off the quality of the triad:

- no qualifier: major
- m: minor (alternatively, lower case RN)
- o: diminished (alternatively, lower case RN + o)



[FMP21] Fig 5.11

Roman numeral notation

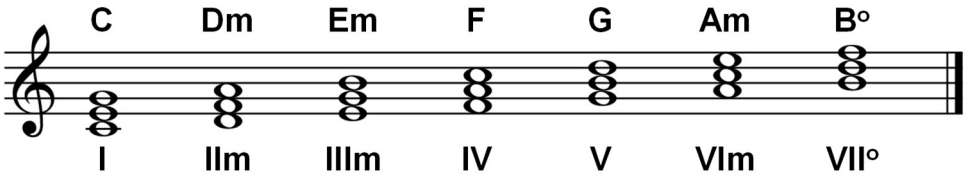
Roman numerals can be used to identify triads (and other chords) with reference to a given scale

We use the Roman numeral equivalent of the scale degree (i.e. index) of the note on which the triad is built

For the above reason, we also frequently refer to triads by the alternative name of the scale degrees presented earlier (but don't get confused with function)

I: tonic

IV: sub-dominant



[FMP21] Fig 5.11

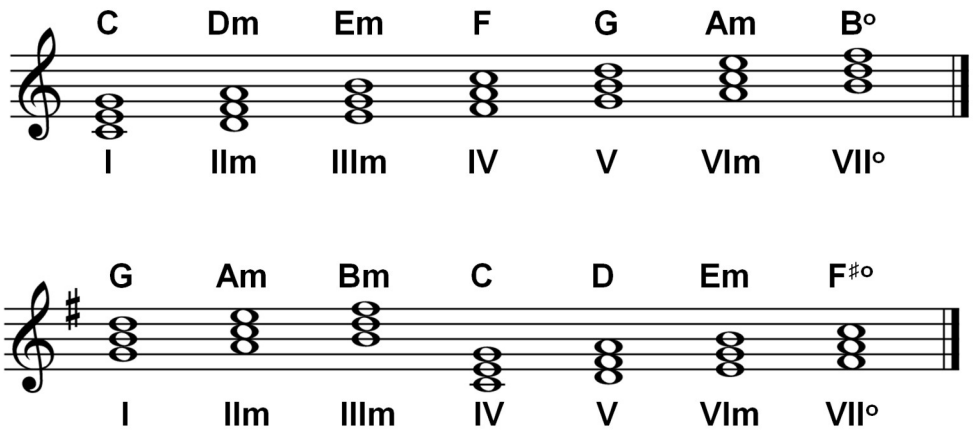
V: dominant

Roman numeral notation

As Roman numeral notation is with reference to a scale, the “same” triad – i.e. the same collection of pitches - can have multiple different Roman numerals associated with it

Shown here is how **G** in the context of the triads built on the C major scale is **V**

...but in the context of the G major scale is **I**



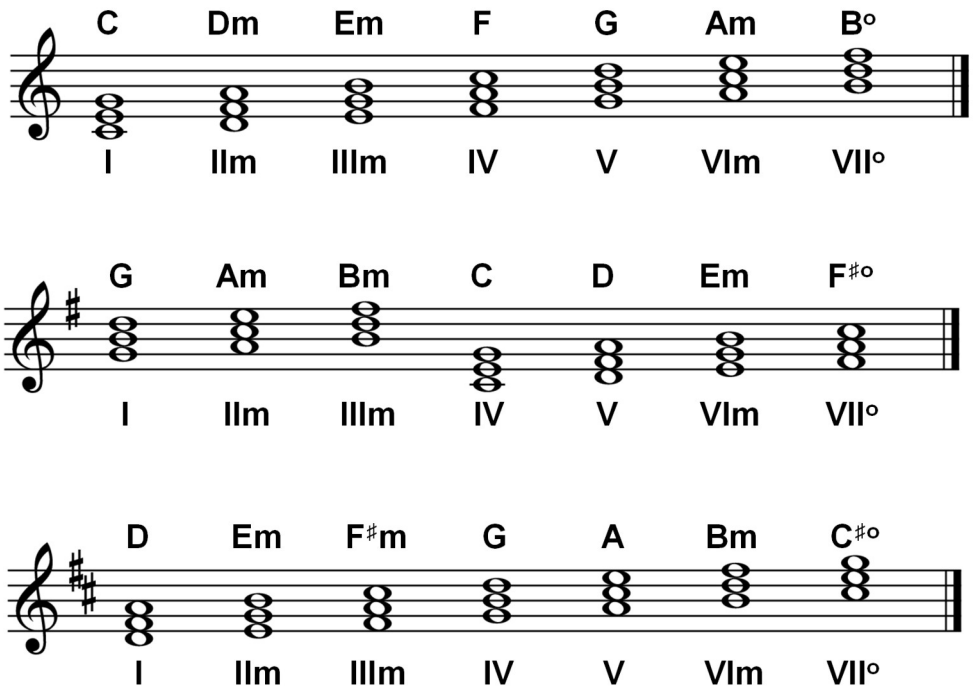
[FMP21] Fig 5.11

Roman numeral notation

As Roman numeral notation is with reference to a scale, the “same” triad – i.e. the same collection of pitches - can have multiple different Roman numerals associated with it

Shown here is how **G** in the context of the triads built on the C major scale is **V**

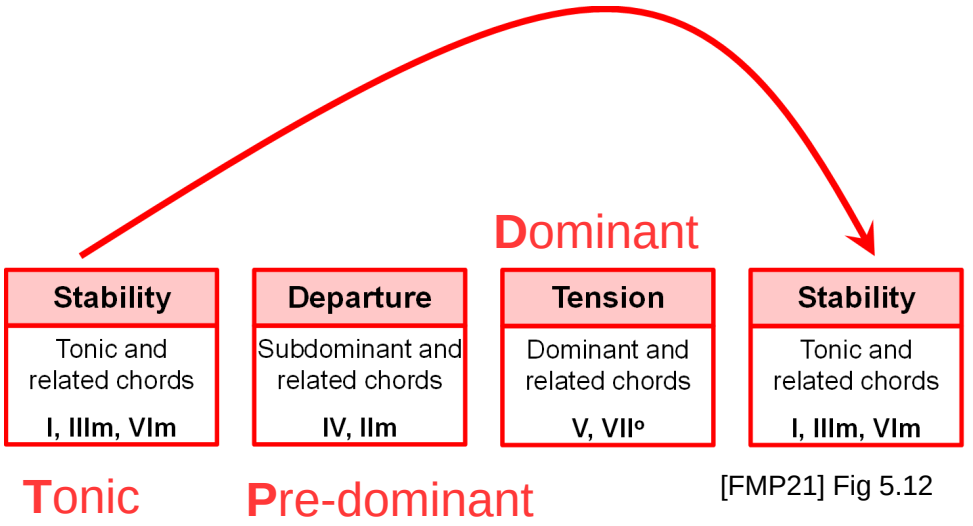
...but in the context of the D major scale is **IV**



[FMP21] Fig 5.11

Function and the sense of tension

Functional labels help us to reason about the constraints on what chords sound good with each other (in succession)



[FMP21] Fig 5.12

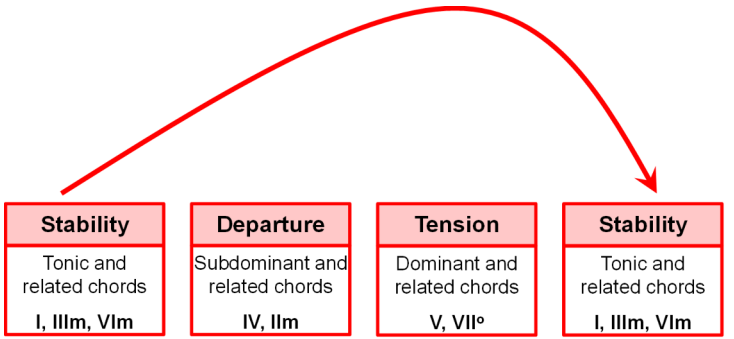
Function and the sense of tension

Chord progressions are stock patterns

Roman numeral notation allows us to think of them in a key-generic way

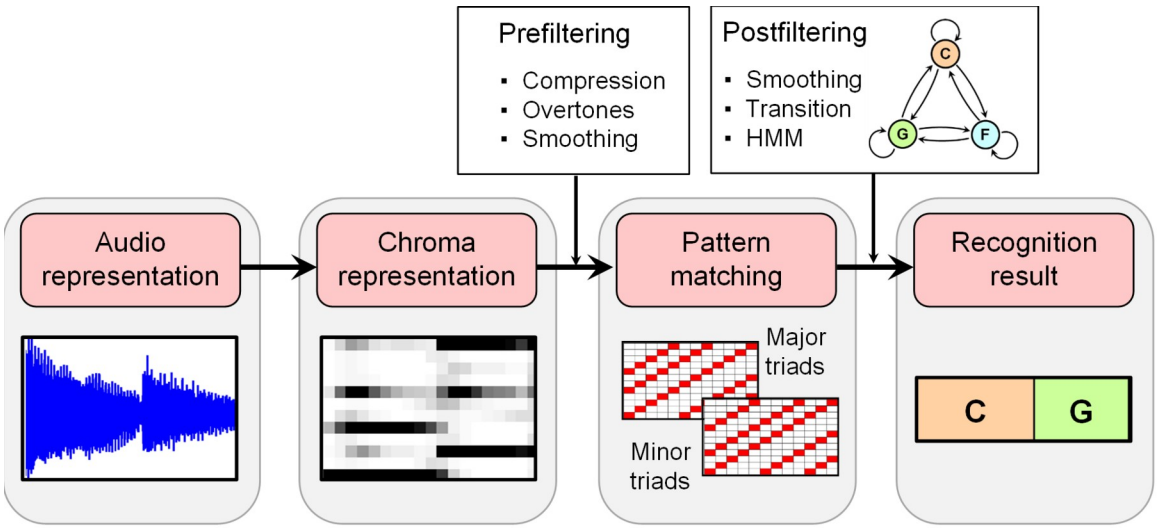
- I – ii – IV – V – I
- I – I – I – I – IV – IV – I – I – IV – I – I
- vi – IV – I – V

and allow us to spot patterns across many pieces, even writing down and ultimately learning grammars that specify musical productions



[FMP21] Fig 5.12

Back to chord recognition again



[FMP21] Fig 5.13

Effect of choice of scales on overall consonance of a generative music work

Consider a simple generative music work that consists in two separate instruments playing an **isochronous** sequence of notes, with pitches drawn at random from a given scale

What is the effect of the choice of scale on the overall degree of consonance of this piece of music?

What do we even mean by “overall” consonance?

Application: Music Mouse

Laurie Spiegel's **Music Mouse**

- 1985-6: Apple Macintosh
- 1986-7: Amiga (with David Silver)
- 1988: Atari ST (David Silver)

Remade by Tero Parviainen (https://teropa.info/musicmouse/)

Amiga version **available on Internet Archive** for emulation

See also, a write up in **Amiga World (March 1988)**
